Recommendation

On Wikipedia, attention to English-language topics is shrinking in all five editions (clipped trend from -0.7 %/yr in German to -65 %/yr for Czech grammar), so the question is which audience is largest and most stable, not which is growing.

Ukrainian readers give the topic by far the biggest share of attention: 107 views per million vs 32–46 in the other editions, though the trend is -15.5 %/yr (high confidence, no spikes, full coverage).

German is the only near-flat market (-0.7 %/yr) but its confidence is low: the trend is not monotonic, so treat it as "stable, noisy" rather than "holding up".

Grammar sub-articles are tiny (≈ 1 per million) and fall faster than the main article everywhere; Polish grammar carries 15 % of its views in two spike months.

- Research the Ukrainian audience first (volume) and the German one second (stability); confirm with interviews, not pageviews.
- Re-run in 3 months with --months 36 and inspect the Polish 2025-07 spike day by day before drawing conclusions from it.

Assumptions: Pageviews filtered to agent=user (human traffic as classified by Wikimedia) and all access methods. Interest is measured as views per million of the whole language edition's views in the same period. The current (incomplete) month is excluded. Growth figures are annualized log-linear trends with spike periods clipped (see references/methodology.md).

Limitations: Wikipedia interest is not willingness to pay; validate promising directions with real user research. Views depend on article existence and quality; a missing or poor article hides real interest. Bot filtering is imperfect; spikes can be automated traffic or news events. A language edition is not a country: readers of one language live in many markets. English grammar|pl: spikes in 2025-07, 2025-09 carry 14.53% of views.
